

Strange Flesh Troubleshooting - macOS

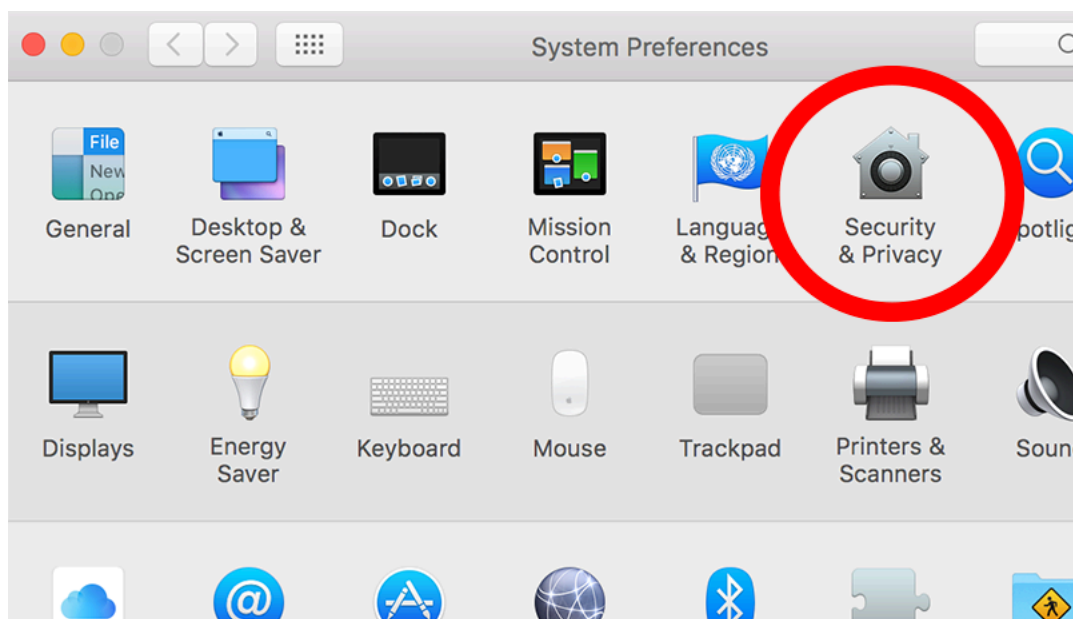

Strange Flesh won't run! What do I do?!

Don't panic. Let's run over some things.

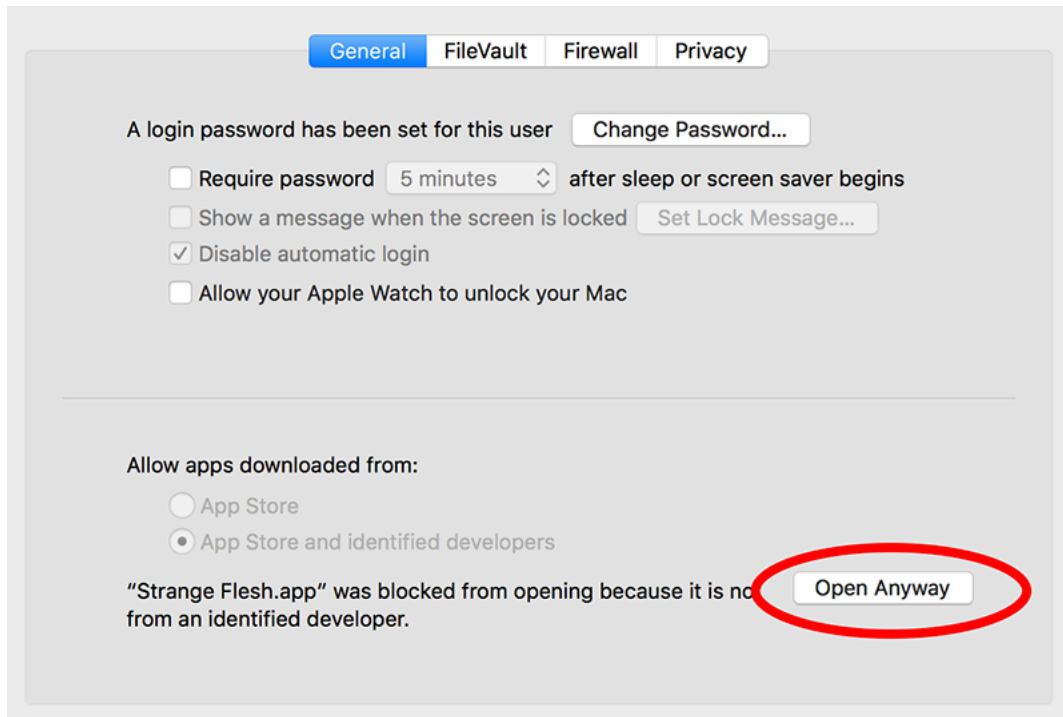

Starting with macOS v10.8, Apple introduced a security feature called GateKeeper. The feature prevents unsigned code from running on Macs. GateKeeper is preventing the game from running if you try to launch and receive this message (or one like it):

This is easy to fix. Try launching the app once to get the message, click "OK", then open up "System Preferences". Open "Security and Privacy".

In the "General" tab, you'll see a message that says: "Strange Flesh.app was blocked from opening..."

Click "Open Anyway" and you're in business. You will only need to do this once. That's it!

Greatest Bear Studios is not an identified developer because that costs \$100 per year and we have made one single free porn game. Not worth it. Sorry if this seems shady! You're welcome to use the web version if you don't want to run an unsigned app.

Strange Flesh still won't run, my problem is something else!

Strange Flesh uses the Electron application framework to run. Electron requires macOS version 10.9 or higher, a 64 bit processor (you have this), and 2GB of RAM (you also have this).

Support for earlier versions of macOS or 32 bit processors is not possible. Upgrade your OS if you are on a version earlier than 10.9 or run the browser version instead. The browser version should work in any roughly modern release of Safari or Chrome. Firefox may work as well but run slowly.
